---

Execute the following URL in the browser: -

<http://localhost:8080/sort>

Once comma separated values are entered and user clicks on sort button, the screen would load the data in the table with the latest value as the first entry.

The table would populate the data with unsorted list which was initially entered by user, the sorted list, time taken for execution of the algorithm and the number of swaps for sorting.

On click of reset button, the entered comma separated values would be reset.
